Steen, H., Soullet, J., Rosenzwajg, M., Nakahara, K., Canki-Klain, N.,
Aurias, A., Siguar, F. and Kirsch, I.R.
MTCP-I. a novel gene on the human chromosome Xq28 translocated to
the T cell receptor alpha/delta locus in mature T cell
proliferations (9), 2475-2483 (1993)
                                                                               Direct Submission
Submitted (05-UU-1993) Marc-Henri Stern, Laboratoire d'Hematologie

//clone="for was performed on DNA from Arabidopsis thatland
//orge="por was performed on DNA from Arabidopsis thaliana
plants (T1) which were transformed with the T-DNA from
vector PACi6i. The lines contain one or more T-DNA from
insertions. The DNA fragment(s) resulting from the PCR
vert directly sequenced to determine the genomic sequence
flanking the insertion. Sequences displaying significant
similarity to the A. thalaha nuclear genome sequence vere
processed for submission. T-DNA derived sequences were
sequences are generated at the MPI for Plant Breeding Research in the context of the GABI-Kat project. GABI-Kat is part of the German Plant Genomics program designated 'GABI'. Information on line availability can be found at:
http://www.mpiz.koelh.mpg.de/GABI-Kat/.

(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a was hydrodynamically sheared by repeated passage through a was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligomucleotides were ligated to the blunt ends in high molar excess: The adaptored ONA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWNA2 (gil/472114|gbl/AF129072.1), a copy.number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coll XL10-Gold (Stratagene) cells and 4 c 21 g 11 t.

//note-forgan: brain; vector: pCMV-SPORT6; Site_1: NoII;
Site_2: Ecory (destroyed); RMA source anonymous pool of 3 fetal brains, female age 20 weeks, female age 24 weeks,
and male age 20 weeks. Library is noilgo-dip primed and directionally cloned (EcoRV site is destroyed upon cloning). Average insert size 1.7 kb, insert size range 0.7-3.5 kb. Library is normalized and enriched for full:length clones and was constructed by C. Gruber (Invitrogen). Research Genetics tracking code 017. Note: this is a NIH-MGC Library.

this year. Take the parameter of the properties passage through a was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end repaired with T4 DNA polymerase and T4 polymurleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb ranew using preparative against green and preparative against green selected for a 9.5 to 10.5 kb ranew using preparative against green and preparative against green and preparative against green and preparative against green and profit green while the preparative against green and green and green with adaptore complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored weetor DNA, and transformed into chamically-competent R. Coll XLIO-Gold (Stratagene) cells and selected for ampicillin resistance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Unpublished (1997)

was hydrodynamically sheared by repeated passage through a was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymeraciotide kinase. Adaptor oligomichocitides were ligated to the blunt ends in high molar excess. The adaptored DNA was purfiled and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gil4732114gplAR129072.1), a copy.number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically competent E. coll XLNO-Gold (Stratagene) cells and selected composition of 15 f.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
